UMI Training Data and Model Licensing Policy

Oct 22, 2026 · UMI Inc.

Every model certified in a UMI cohort is a public, non-commercial research model released under CC BY-NC-SA 4.0. That single rule is what lets miners train on NonCommercial datasets such as How2Sign alongside FLEURS-ASL, and it is the basis on which UMI accepts, certifies, rewards and publishes cohort models. This document states the rules, the reasons for them, and what each miner must do.

1. The policy in brief

The rules below apply to every cohort submission. A model that does not meet them is not certified.

1. **All cohort models are public research models.** Certified weights are published by UMI on the UMI model repository for anyone to download. There is no private or exclusive track.
2. **All cohort models are released under CC BY-NC-SA 4.0.** Weights, the portable bundle and any adapter files carry CC BY-NC-SA 4.0. UMI-authored runtime code stays Apache-2.0; your own inference code may be Apache-2.0 or MIT.
3. **You may train on NonCommercial datasets.** Datasets under CC BY-NC 4.0 or CC BY-NC-SA 4.0 with no additional contractual restrictions are permitted, including How2Sign. Section 3 lists the license classes and the rulings for named datasets.
4. **You may not train on datasets with bespoke research or access contracts** (for example the Microsoft Research License Terms that govern ASL STEM Wiki) unless UMI has the rights holder's written permission on file. Section 9 lists the permissions UMI is pursuing.
5. **Every submission carries a provenance declaration and a rights warranty** listing each dataset by name, version, URL, license and download route (section 5).
6. **Every bundle attributes its sources** in a NOTICE file in the form section 4 specifies, and reproduces each dataset's responsible-use requests.
7. **Awards are retroactive.** Emissions for a cohort are set only after its results are certified and run for a bounded window until the next cohort is certified. Public NC release is a condition of the award.

8. **UMI does not deploy cohort models commercially.** UMI does not run inference on cohort models for money, does not bundle, link, default to or document them in any app, and does not use them to build a product model. The UMI app is a general-purpose runtime; whatever model a user chooses to load is the user's choice under that model's license.
9. **You delete what you must delete.** Where a dataset's terms require destruction after use, you destroy your copy and all derived files after training and attest to it.
10. **No faces in publicity.** Dataset videos never appear in demos or marketing without blurring where the dataset asks for it, and never where its terms forbid it.

2. Why cohort models are non-commercial research models

UMI's cohorts convert paid effort into a public good in the same way a university converts salaried effort into publications, and the NonCommercial test is applied to that use, not to the people who perform it or to the money that funds it. The rules in section 1 are the facts that make this true, and each of them maps to a reason.

The test looks at the use. The Creative Commons NonCommercial element permits any use that is "not primarily intended for or directed towards commercial advantage or monetary compensation." Creative Commons applies this to the use, not the user: a nonprofit can breach it and a company can comply with it, and the courts that have construed it (*Great Minds v. FedEx Office*, 2d Cir. 2018; *Great Minds v. Office Depot*, 9th Cir. 2019) measure the licensee's own use and ignore paid intermediaries. The salary of the person doing the work, the revenue of the institution and the motives of the participants are all outside the test. University researchers are paid; universities sell tickets and charge tuition; their research use of NC data is treated as non-commercial everywhere. The same test cannot invoke pay, revenue or motive against UMI.

The use is the production of a public research model. The required output of a cohort is a model released to the public under CC BY-NC-SA 4.0, certified against a benchmark, with results published. That is research output in the ordinary machine-learning sense. Public release is the outcome that research licensors want most, and it is more than much university research delivers, since much of that is never disclosed.

The award is recognition, not purchase. Emissions for a cohort are set only after certification, for a bounded window, for a model that already exists in public. No buyer acquires the model, nothing is exclusive and nothing is transferred. This is retroactive public-goods funding, an established grant form. Grants are awarded on expected quality,

prizes and renewals on delivered quality, so a payment that tracks quality is not what distinguishes a grant from a sale; what distinguishes them is whether the funder acquires and exploits the output or recognises a contribution to the public. UMI acquires nothing.

The output stays non-commercial. CC BY-NC-SA 4.0 on the weights is the downstream condition the NC license itself imposes on shared adaptations, and Creative Commons' own guidance on AI training treats a model shared non-commercially as compliant. UMI does not deploy cohort models commercially, does not put them in its app and does not build product models from them, so the public good remains a public good after certification.

The licensor's intent is honoured. Research licensors use NC and research-only language to prevent appropriation, secrecy and commercial products. A public NC-SA model involves none of those. How2Sign's signers consented to public availability for research, and a public research model is what they get; the How2Sign site's "research purposes only" sentence sits on top of a CC BY-NC 4.0 grant and describes exactly this outcome.

Deployment is the user's act. The UMI app is a general-purpose on-device runtime that loads whatever model a user supplies. A user who loads an NC model for personal, non-commercial use receives the license automatically and makes a licensed use; where no one in the chain infringes, there is nothing for secondary liability to attach to, and a general-purpose runtime with substantial lawful uses is itself lawful. UMI's only act is publishing the model non-commercially, and the app never points at it.

These reasons are only as good as the facts, which is why section 1 is written as rules and why section 6 keeps UMI's own conduct inside them.

3. Which datasets you may train on

A dataset is eligible when its license permits reproduction and adaptation for non-commercial research and allows the resulting work to be shared under CC BY-NC-SA 4.0, and when nothing beyond the public license was accepted to obtain it. Classify by the terms actually attached to the copy you download, not by what a paper or a mirror says.

License class	Eligible?	Why
CC0, public domain	Yes	No conditions
CC BY 4.0, CC BY 3.0	Yes	Attribution only; carried in NOTICE

License class	Eligible?	Why
CC BY-SA 4.0, CC BY-SA 3.0 (FLEURS-ASL, FLORES, Wikipedia text)	Yes	Attribution and ShareAlike; UMI's position is that weights are not an adaptation of the dataset, and the CC BY-NC-SA 4.0 release honours the more restrictive source in a mixed model; see section 9 for the confirmation UMI is seeking from Google Research
CC BY-NC 4.0, CC BY-NC-SA 4.0 (How2Sign)	Yes	Non-commercial research use and NC-SA release match the license's own conditions
Apache-2.0, MIT, BSD, ODC-By, CDLA-Permissive	Yes	Attribution and notice only
CC BY-ND, CC BY-NC-ND, any no-derivatives term	No	Training produces an adaptation on the licensor's own reading
Bespoke research or access agreements (Microsoft Research License Terms, ELRA end-user licences, click-through academic agreements)	No, unless UMI holds written permission	These are contracts with terms beyond NC, typically no distribution of modifications, destruction after use, named-institution or named-user limits
Scraped video, YouTube, social platforms, unlicensed mirrors	No	No license; platform terms prohibit it; signer consent absent
UMI consented data (collected through the UMI app under the UMI contributor consent)	Yes	Consent and license cover training, public release and NC-SA distribution

Rulings for named datasets. These are the datasets miners have asked about. Rulings change only when UMI records a new permission in section 9.

Dataset	Ruling	Conditions
FLEURS-ASL (Google Research, CC BY-SA 4.0)	Allowed	Attribute FLEURS-ASL and FLORES in NOTICE; reproduce the Responsible Use requests (blur faces in publicity, no reidentification, no deepfakes)
How2Sign (UPC, BSC, CMU, Gallaudet; CC BY-NC 4.0)	Allowed with conditions	Attribute the How2Sign consortium and cite the CVPR 2021 paper; release under CC BY-NC-SA 4.0; do not redistribute the videos, clips, landmarks or English sentences; do not train the How2 source transcripts into a model intended for any other track
ASL STEM Wiki (Microsoft, Microsoft Research License Terms)	Pending permission	Not permitted until Microsoft's written confirmation is recorded in section 9; the terms forbid distributing modifications and require destruction after use, which the NC track does not satisfy on its own
2M-Flores-ASL, FSboard, Taskmaster-1 (UMI reference-model lineage)	Allowed	Attribute as the reference model's NOTICE does; each is CC BY or CC BY-SA
UMI consented data	Allowed	Attribute as "UMI contributors"; no per-contributor identification

A dataset not listed here is eligible if it falls in a "Yes" class above and you record its terms in your provenance declaration. If you are unsure which class applies, ask before training; rulings are added to this table as they are made.

4. How to license and label your bundle

The bundle carries one license per component and a NOTICE file that lets anyone trace every source. A bundle label never widens the rights in the training data; it records the rights that exist.

Component	License	What the file must say
Weights, adapters, tokenizer and label vocabularies, portable bundle	CC BY-NC-SA 4.0	`LICENSE-WEIGHTS` containing the CC BY-NC-SA 4.0 legal code or its URL
Your inference code and configs	Apache-2.0 or MIT	`LICENSE` for the code
UMI runtime and extractor code you redistribute	Apache-2.0 (unchanged)	UMI's own `LICENSE` and `THIRD_PARTY_NOTICES` retained
Model card	CC BY 4.0	`MODEL_CARD.md`
NOTICE	n/a	`NOTICE` as specified below

The NOTICE file. One entry per dataset, in this form, and one entry for any base checkpoint you fine-tuned:

```
SOURCE: How2Sign v1.0
HOLDER: How2Sign consortium (Universitat Politècnica de Catalunya, Barcelona
Supercomputing Center, Carnegie Mellon University, Gallaudet University)
LICENSE: CC BY-NC 4.0, https://creativecommons.org/licenses/by-nc/4.0/
URL: https://how2sign.github.io/
CITE: Duarte et al., "How2Sign: A Large-scale Multimodal Dataset for
Continuous American Sign Language," CVPR 2021
USE: Training data for this model. The dataset itself is not redistributed.
The weights are modified work derived in part from this source.
REQUESTS: Research use; no redistribution of videos; no identification of
signers.
```

For FLEURS-ASL the entry names Google Research, CC BY-SA 4.0, the Kaggle URL, the NAACL 2025 paper, and reproduces the Responsible Use paragraph (blur faces when publicising examples; no reidentification; no deepfakes). For FLORES text used through

FLEURS-ASL, name FLORES and CC BY-SA 4.0. For Wikipedia-derived text, name Wikipedia and CC BY-SA. For UMI consented data, name "UMI contributors" and the UMI contributor consent.

The model card states the task, the architecture in one paragraph, every training and evaluation dataset by name and version, the license of each component, the memorisation test result, the statement "This is a research model released under CC BY-NC-SA 4.0. It is not a product, not an interpreter, and not for commercial use," and the cohort and certification date.

Fine-tuning a certified checkpoint. Any adaptation of a CC BY-NC-SA 4.0 cohort checkpoint must be released under CC BY-NC-SA 4.0, attribute the checkpoint and its cohort, and inherit its NOTICE entries in full.

5. What to submit with a model

A submission is complete when the items below are in the bundle or attached to it. Validators do not score an incomplete submission.

1. **Provenance declaration.** A `PROVENANCE.json` listing every training and evaluation dataset: name, version, canonical URL, license (SPDX identifier where one exists), the route you downloaded it by (direct link, Kaggle, Google Drive, mirror), the date, the archive file names with SHA-256 hashes, and any terms you accepted to obtain it (account terms of service, click-through, request form). A dataset you cannot describe this way is not eligible.
2. **Rights warranty.** A signed statement that each listed dataset falls within a "Yes" class in section 3 or carries a permission recorded in section 9, that you accepted no terms beyond the public license, that no training video, frame, landmark cache, caption or sentence list is included in the bundle, and that you grant UMI a worldwide, perpetual, royalty-free, sublicensable license to evaluate, store, publish and use the submission as a research baseline under CC BY-NC-SA 4.0.
3. **Memorisation test.** The output of UMI's regurgitation probe: the model is prompted with held-out video from each training source and its text outputs are matched against that source's reference sentences; report the verbatim-match rate and the longest matched span. A checkpoint that reproduces reference sentences verbatim at above the published threshold is not certified until retrained.
4. **Bundle inventory.** A file list with hashes, and a statement that the bundle contains weights, code, configs, model card and notices only.

5. **Destruction attestation**, where a dataset's terms require destruction after use: the date you deleted the dataset and all derived files.
6. **NOTICE and model card** as section 4 specifies.

UMI keeps the declaration, warranty, test output and inventory with the certified checkpoint's hash for as long as the checkpoint is published.

6. Certification, awards, and what UMI does with certified models

The program is designed so that the award recognises a public research deliverable that already exists, and so that UMI's own conduct never turns that deliverable into a product.

Certification. A cohort closes on its published date. Validators score each complete submission against the cohort benchmark on sealed references, check the provenance declaration against section 3, and run the memorisation probe. A model that passes is certified and its weights, NOTICE and model card are published on the UMI model repository under CC BY-NC-SA 4.0, behind a notice stating the license and the non-commercial condition.

Awards. Incentive weights for a cohort go live only after its results are certified and remain live until the next cohort is certified. The award is for the certified public model; it is not a fee for serving inference, and no cohort model is served by UMI or by validators as a paid service. Public release under CC BY-NC-SA 4.0 is a condition of the award: a miner who withdraws or relicenses a certified model forfeits the remaining window.

What UMI does with certified models. UMI stores, evaluates and publishes them; uses them as baselines and reference points for later cohorts; cites them in research results. UMI does not run inference on them for money, does not include them in, link to them from, set them as defaults in, or document them for any UMI app, and does not use them or their outputs to build or bootstrap a product model. The UMI app is a general-purpose on-device runtime that loads any model file a user supplies; it ships with no cohort model and no pointer to one. What a user loads is that user's choice under the model's own license.

Publicity. Dataset videos and frames appear in UMI materials only where the dataset's terms and the signers' consent allow it, with faces blurred where the dataset asks. Certified models are described publicly as research models, never as product or app models.

Takedown. A rights holder or a signer who objects to a certified model may write to UMI; UMI will unpublish the checkpoint and stop using it as a baseline while the objection is reviewed, and will record the outcome in section 9.

7. Dataset terms on record

The table records the license text, access terms, signer consent and provenance of each dataset named in section 3, as read from the live pages and metadata. It is the reference for the rulings above and is updated when a rights holder's reply is recorded in section 9.

Dataset	Rights holder and version	License text in force	Access and acquisition terms	Signer consent on record	Provenance notes
ASL STEM Wiki	Microsoft Corporation; v1.0, published 15 Oct 2024, ASL_STEM_Wiki.zip, 187.4 GB, Download Center	Microsoft Research License Terms: use "solely for non-commercial, non-revenue generating, research purposes" (s.1); data may be used and modified only "consistent with the consent under which the data was provided" and "you may not distribute the data or your modifications to the data" (s.1(c)); no sharing, publishing, distributing or hosting of the Materials (s.2(e)); personal data used only for consented purposes, kept in strict confidence, never shared, and destroyed "immediately upon the completion of your research" (s.3); results may be published if no material or substantial portion of the Materials is included (s.5); disputes by individual arbitration, King County WA venue (ss.9, 11)	Direct zip download, no click-through on the download page; the project page points to the license tab and says commercial use requires contacting ASL_Citizen@microsoft.com	Consent form: data used "primarily to perform research"; "may eventually be used to develop and improve our commercial products" (Microsoft's); public dataset release "to help advance research"; license of image and likeness to Microsoft "for the research project above and in any related services"; collected under IRB approval; 37 paid professional interpreters, faces visible	64,266 videos of 254 English Wikipedia STEM articles; the English text layer is Wikipedia content under CC BY-SA 3.0 and GFDL (datasheet); datasheet says the data "should not be used to develop technology that purports to replace sign language interpreters"
How2Sign	How2Sign consortium (UPC, BSC, CMU, Gallaudet; "©Copyright How2Sign"); v1.0; ELRA catalogue entry ELRA-S0416 available from 29 Sep 2022; CORA.RDR deposit doi:10.34810/data33 v1.0, 2024	CC BY-NC 4.0: reproduction, sharing and Adapted Material "for NonCommercial purposes only" (s.2(a)(1)); NonCommercial means "not primarily intended for or directed towards commercial advantage or monetary compensation" (s.1(i)); attribution per s.3(a); rights terminate automatically on breach (s.6(a)); no restriction on uses lawful without permission (s.8(a)). Site adds: "publicly available for research purposes only" and "you may NOT use the material for commercial purposes"	Google Drive links plus a GitHub download script; no click-through or request form on the site; ELRA lists the same CC-BY-NC-4.0 licence for academic and commercial users at EUR 0 (no commercial licence offered); the CORA.RDR deposit carries "custom dataset terms" behind a bot wall, not yet retrieved (section 9)	Paper s.3.5: 11 signers (4 Deaf, 2 hard of hearing, 5 hearing) signed a consent form "agreeing on being recorded and making their data publicly available for research purposes"; CMU IRB; faces visible	~80 hours of ASL translations of How2 instructional videos; English sentences come from the uploader-provided subtitle track of the How2 source videos; the site says "for copyright reasons, we are not allowed to redistribute the How2 data"

Dataset	Rights holder and version	License text in force	Access and acquisition terms	Signer consent on record	Provenance notes
FLEURS-ASL	Google Research; Kaggle dataset published 13 Aug 2024, last modified 29 Aug 2024, archive 24.79 GB; paper NAACL 2025	CC BY-SA 4.0 (Kaggle Croissant metadata: license name "CC BY-SA 4.0", creativecommons.org/licenses/by-sa/4.0; paper footnote: released "under CC BY-SA 4.0"). Attribution per s.3(a); ShareAlike per s.3(b) applies to Adapted Material that is Shared; s.8(a) as above	Kaggle account and Kaggle terms of service required to download; no dataset-specific click-through. Description adds non-binding "Responsible Use" requests: blur faces when publicizing examples, do not reidentify interpreters, do not use likenesses for deepfakes	5 paid Certified Deaf Interpreters; "all interpreters gave informed consent for the use of this data in machine learning" and to publication for ML research by the broader community; faces unblurred in the release	7.49 hours, 1,749 sentences; the English layer is FLORES dev/devtest text (FLORES+ successor is CC BY-SA 4.0), which is why Google chose ShareAlike; the FLEURS speech card says CC BY 4.0, an inconsistency that does not affect FLEURS-ASL's own license

8. Legal basis

UMI's position is that cohort training on NonCommercial datasets is a licensed non-commercial research use; that, independently, the training copies are fair use in the United States and text-and-data-mining in the EU; that trained weights are not a copy or adaptation of any dataset; and that deployment by users in a general-purpose runtime is the users' own licensed act. The position is stated under United States law as of 22 October 2026, with EU and UK notes where the result differs, and rests on the authorities in the table that follows.

I. The NonCommercial test is use-based. CC BY-NC 4.0 s.1(i) defines NonCommercial as "not primarily intended for or directed towards commercial advantage or monetary compensation." Creative Commons' interpretation guidance makes the test turn on the use rather than the user; *Great Minds v. FedEx Office*, 886 F.3d 91 (2d Cir. 2018), and *Great Minds v. Office Depot* (9th Cir. 2019) measure the licensee's own use and disregard paid intermediaries; Creative Commons' guidance on AI training (28 May 2025) states that the license applies only where copyright permission is required, that NC is satisfied when each permission-requiring step is non-commercial, and that a model shared non-commercially complies. Section 8(a) of every CC 4.0 license confirms that the license imposes no condition on a use that is lawful without permission.

II. Cohort training is a non-commercial research use. The use is the reproduction of a dataset to train a model whose required output is a public model released under CC BY-NC-SA 4.0, certified against a benchmark, with published results. The award is retroactive, bounded, and recognises a deliverable that already exists in public without

any transfer or exclusivity, which is the structure of retroactive public-goods funding rather than a purchase. The miners' motives and compensation are outside the test for the same reason a researcher's salary is. The output is shared on the terms the NC license itself prescribes for adaptations, and the licensor's purposes in choosing NC, the prevention of appropriation, secrecy and commercial products, are served by the release. How2Sign's "research purposes only" sentence sits on top of a CC BY-NC 4.0 grant with no assent mechanism and describes this outcome.

III. The training copies are independently lawful without any license. Intermediate, non-expressive copying to build a functional tool is fair use under *Sega v. Accolade* (9th Cir. 1992), *Sony v. Connectix* (9th Cir. 2000), *Authors Guild v. Google* (2d Cir. 2015) and *Google v. Oracle* (2021), applied to model training in *Bartz v. Anthropic* (N.D. Cal. 23 Jun 2025) and *Kadrey v. Meta* (N.D. Cal. 25 Jun 2025). The works are thin (green-screen linguistic recordings; factual transcripts); the model does not substitute for a benchmark corpus; no commercial license is offered anywhere for the NC datasets, which the Copyright Office's Part 3 report treats as weighing toward fair use; and a public NC release is nonprofit dissemination. *Thomson Reuters v. Ross* (3d Cir. 29 Sep 2026) concerned a non-generative tool competing directly in a market where licensing was available and expressly reserved generative models. In the EU, Art. 4 of Directive 2019/790 covers the training copies for lawfully accessible content not reserved by the rights holder, and Creative Commons' statement of 17 Dec 2021 confirms that CC licenses are not Art. 4 reservations.

IV. Weights are not a copy or adaptation of the datasets. *Getty Images v. Stability AI* [2025] EWHC 2863 (Ch) holds that a model which stores no copy of the works is not an infringing copy, and the Copyright Office confines infringement by weights to retained, memorised protectable expression. A landmark-based model that emits short English strings retains no video expression; the memorisation probe in section 5 verifies this for each checkpoint. Because nothing in the dataset licenses reaches the weights, the CC BY-NC-SA 4.0 release is UMI's own license choice, applied to honour the most restrictive source in a mixed model; FLEURS-ASL's ShareAlike, which requires a BY-SA adapter license only for adaptations, is addressed by the confirmation UMI is seeking from Google Research (section 9).

V. Deployment by users is the users' licensed act. The UMI app is a general-purpose on-device runtime with substantial lawful uses that loads any model a user supplies and ships with no cohort model. A user who loads a CC BY-NC-SA 4.0 model for personal non-commercial use receives the license under s.2(a)(5) and makes a licensed use; absent direct infringement there is no secondary liability (*Sony v. Universal*; *MGM v. Grokster*),

and general-purpose runtimes are lawful (*Sony v. Connectix*; *Sony v. Bleem*). UMI's own act is the non-commercial publication of the model, and section 6 keeps every UMI pointer out of the app.

VI. Bespoke contracts are outside this basis. Datasets governed by individual license agreements, such as ASL STEM Wiki under the Microsoft Research License Terms, impose obligations (no distribution of modifications, destruction after use, use within the data subjects' consent) that are contractual and do not turn on the analysis above. They are eligible only on the rights holder's written permission.

Privacy and publicity. The datasets show interpreters' faces. A text-output model stores no likeness and identifies no one; landmark extraction for translation is not biometric identification; in the EU the processing rests on legitimate interests under EDPB Opinion 28/2024; dataset videos are used in publicity only as section 6 allows.

Authorities. Settled rules are the license texts and the cases construing them; the application of fair use, TDM exceptions and the status of weights to model training is still being decided, and the table records where each authority stood on 22 October 2026.

Authority	Court and date	What it decided	Status on 22 Oct 2026
Bartz v. Anthropic	N.D. Cal., 23 Jun 2025 (Alsup)	Training on lawfully acquired books is "exceedingly transformative" fair use; a permanent library of pirated copies is not	Class settlement (USD 1.5 bn) finally approved 20 Jul 2026; fair-use ruling never reviewed on appeal; only fee appeals pending in the Ninth Circuit
Kadrey v. Meta	N.D. Cal., 25 Jun 2025 (Chhabria)	Training Llama held highly transformative; plaintiffs failed on market harm; market-dilution theory noted as the strongest unargued objection	Distribution claim set for hearing Feb 2027; interlocutory appeal denied 8 Jul 2026

Authority	Court and date	What it decided	Status on 22 Oct 2026
Thomson Reuters v. Ross	3d Cir., 29 Sep 2026 (precedential), affirming D. Del. 11 Feb 2025	Fair use rejected for a non-generative legal-research AI trained on headnotes: commercial, minimally transformative, harm to the licensing market for AI-training data; footnote expressly leaves generative AI open	Rehearing petition deadline extended to 3 Nov 2026; cert petition signalled
US Copyright Office, Copyright and AI Part 3	Pre-publication report, 9 May 2025	Weights can infringe the reproduction and derivative-work rights where the model retains substantial protectable expression; copying weights infringes only with substantial similarity; commerciality turns on substance, not labels; where a licensing market exists unlicensed use is disfavored	Still pre-publication; final version promised without substantive change

Authority	Court and date	What it decided	Status on 22 Oct 2026
Getty Images v. Stability AI	England and Wales High Court, [2025] EWHC 2863 (Ch), 4 Nov 2025	A trained model that does not store or reproduce the works is not an "infringing copy" under CDPA s.27; secondary-infringement claim dismissed; primary training claims withdrawn because training happened outside the UK	Permission to appeal the s.27 point granted Dec 2025; Court of Appeal date not yet listed
GEMA v. OpenAI	Landgericht München I, 42 O 14139/24, 11 Nov 2025	Lyrics memorised in model parameters are a reproduction; TDM exception covers training in general but not memorisation of specific works; outputs infringe	Appeal lodged Dec 2025 (OLG München 6 U 3662/25 e), pending
Kneschke v. LAION	LG Hamburg 27 Sep 2024; OLG Hamburg 10 Dec 2025	Downloading images to build a research dataset is TDM under §44b UrhG (Art. 4 DSM) and also §60d (Art. 3) because LAION is a non-commercial research organisation; a natural-language reservation was not shown to be machine-readable	BGH I ZR 281/25 heard 3 Sep 2026, decision due 17 Dec 2026, CJEU referral signalled
Like Company v. Google, C-250/25	CJEU, referred Apr 2025, Grand Chamber hearing 10 Mar 2026	Whether LLM training is a reproduction and whether Art. 4 TDM covers it	AG opinion not confirmed; judgment not expected before 2027

9. Pending confirmations

UMI puts its characterisation to each rights holder in writing and records the reply here. A "Pending permission" ruling in section 3 becomes "Allowed" or "Not permitted" when the corresponding line is updated.

Rights holder	What UMI has asked	Status
Microsoft (ASL STEM Wiki), ASL_Citizen@microsoft.com	Written confirmation that UMI cohort training on v1.0, with CC BY-NC-SA 4.0 public release of weights, destruction of the dataset and derived files after training, and no distribution of modifications, is within the Microsoft Research License Terms and the interpreter consent; or a variation permitting it	Request to be sent; ruling stays Pending permission until a reply is recorded
How2Sign consortium (UPC, BSC, CMU, Gallaudet), via the CORA.RDR contact and ELDA	Notice of this policy and of UMI's reading that cohort training with CC BY-NC-SA 4.0 release is a non-commercial research use within CC BY-NC 4.0; request for the CORA.RDR custom dataset terms	Notice to be sent; ruling is Allowed with conditions and is not contingent on a reply
Google Research (FLEURS-ASL)	Confirmation that release of a mixed model under CC BY-NC-SA 4.0 with attribution to FLEURS-ASL and FLORES is acceptable where ShareAlike would otherwise call for CC BY-SA 4.0	Request to be sent; ruling is Allowed and is not contingent on a reply
